Cisco linksys e4200 router ip address

By Katherine Johnson Linksys offers routers for both home users and small businesses. You can access the Linksys router to change your router settings, update the firmware or change the Linksys router configuration files. The router has an integrated administration page that allows you to perform these tasks by connecting directly to the router using an Ethernet cable. To access the router, you need a username and a password. Connect the power cord to the Linksys router. Connect an Ethernet cable to the computer network card and an open port on the Linksys router. Open your favorite browser and enter "192.168.1.1" in the address bar and press the "Enter" button. This is the address used for the integrated management page of the Linksys router. Enter the username and password of the router to access the router. If you have not changed this information, the default username can be left empty. Some routers can use the name "admin" and can also request a password that is also "admin". Click on the "OK" button. Now you can access the router configuration page, or if the router has already been set, you can access the router settings. By C. Taylor Login to the administration utility of your Linksys Wireless G router via its Internet protocol or IP address. The default address is 192.168.1.1, but if you have changed and subsequently forgotten this address, the reset of the router will also restore the IP address to its default setting. However, this will also beall router settings, so a much better alternative is to move the IP address, access the router and change it manually. This method allows you to preserve the other settings of the router and to further control the new IP address, which is useful for correcting conflicts with other network devices that share the current address of the router. Connect an Ethernet cable from one of the four numbered ports on the back of the Linksys router to the computer's Ethernet port. This establishes a wired connection with the router. Although you can do this by using a wireless connection, you would immediately disconnect from the administration utility after making the necessary changes. Press "Win-R", type "cmd" (without quotations) and press "Enter" to run the command prompt in any modern version of Windows. Type "ipconfig" (without quotations) in the Command Prompt window and press "Enter". Look for the IP address of the router next to the default Gateway in the wireless LAN adapter header. Enter the IP address in the address bar of your browser and enter "admin" (without quotations) in the login page password field. Leave the field empty username. Click the "Setup" tab on the "Basic Setup" subtab and then on the "Network Address" side menu. Enter the new IP address in the "Local IP Address" field. Maintain "192.168" (without quotations) as the first two numbers. The last two numbers can range from zero to 255. Click "Save Settings" to restore your IP address. You can then disconnect Ethernet cable from the router and resume normal wireless function. Linksys routers are common small-house components at large corporate networks. These devices direct traffic within the network and help combine different machines for Internet access. Linksys routers have the ability to serve IP addresses to internal network users using the DHCP protocol. However, you can turn off this option. When deactivating DHCP management, the router is just a simple hub, which does nothing but connect computer wires so they can communicate. DHCP switch is made in the router console. Open a web browser and type the IP address of the Linksys router in the navigation text box. The default IP address for Linksys routers is 192.168.1.1. Enter the administrator's password in the prompt. For default values, Linksys sets the administrator username as blank and the password is "admin". Click on the "DHCP" tab at the top of the Linksys configuration console. In this window you can set DHCP configurations. Select "Disable" in the first option section. Click the "Save Settings" button to confirm the changes. Now the router acts as a hub and does not need IP addresses to network computers. It is difficult to fathom because Cisco did not add IPv6 to its Linksys consumer routers yet, but the company promised support will arrive this spring. These are the 2011 IPv4 addresses, officially exhausted, and the world's largest router manufacturer, Cisco, still does not support in its best-selling line of wireless router Linksys. This is also true for the new E4200 router released only last month (price to \$180). The company promised to have IPv6 support for the Linksys line by spring but was no longer specific. The network world has been aware of the lack of IPv4 addresses for years. The competitors of Cisco D-Link and Netgear, for example, offer certified IPv6 consumption routers for a while. Cisco business routers support IPv6 (naturally) and have been certified by the IPv6 Forum. Cisco was involved in the IPv6 Day world trials and last year he also began to eat his own food for IPv6 dogs, serving the IPv6 content through his website www.ipv6.cisco.com. PC clients had IPv6 support as an optional add-on from Windows XP SP2 and by default from Vista. Mac OS supports IPv6 since 2004. Network World contacted Cisco and asked for more information on Cisco's plans for its consumer routers. We asked, if "the plans to support IPv6 in the spring", did it mean that people who buy new routers will now be able to get an update that adds IPv6? If so, we wanted to know if that update would be free, or how much it would cost. Cisco did not address these questions, but offered this official statement: "IPv6 is crucial for the next generation Internet, allowing a range of new services and improved user experiences. As ISPs start distributing IPv6 service to their customers, consumers will need new routers and gateways that support IPv6 for in this new generation internet." "In this spring, Cisco will begin to enable IPv6 through its line of consumer routers, including Linksys e4200 maximum performance Dual-Band Wireless-N router. It is essential that consumers start looking for products and devices that support IPv6". "Cisco has been and will continue to be a leader in the development of IPv6 so that consumers can feel confident that Cisco products will provide top-line performance now and provide a basis for the future." "After reading the statement we asked to Cisco if the words "consumers will need new routers and gateways that support IPv6" meant that Cisco will require its customers to buy new routers with IPv6 support when these routers become available. We asked again if there would have been a route for those who recently purchased new routers to get IPv6 when Cisco distributes it, and if those who own older routers will also be offered IPv6 support. We have not received an answer. However, when we asked similar questions to Netgear, a company representative told us, "most Netgear routers today not only support IPv6, but are certified as well. We are working on IPv6 support for all our current shipping routers and will be available for customers in the form of a firmware update." For example, the IPv6 Netgear certified routers include WNR3700, WNR1000, WNR3400, WNR3500 and WNR3500L routers. Its new double-band gigabit router, the WNR3800, announced to the CES and competing with Linksys e4200, will also be IPv6 when you ship in spring. Similarly, the IPv6 Forum has listed dozens of other consumer routers that are already certified and ready for the day you would be asked to address an IPv6 address. In the meantime, if the E4200 took your imagination, we might recommend following Cisco's advice and "start looking for products and devices that support IPv6".
